

What Can You Do For Gaia?

To the ancient Greek, Gaia is Mother Earth.

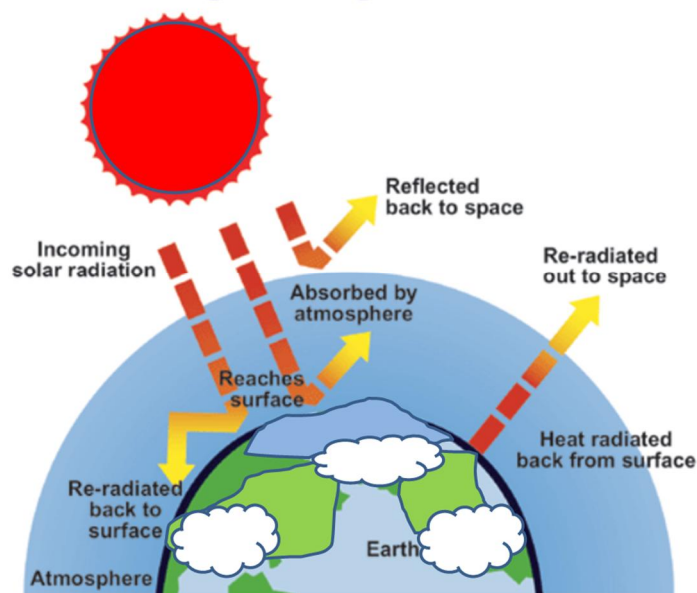

Saving Gaia is an urgent appeal for action. Gaia is our home planet. It is the air that we breathe, the water that we drink, the things that we see.

Gaia is changing. In a way, you can say it is dying. When the environment changes become too extreme, human may not be able to adapt and will perish. Even subtle changes will have tremendous impact on our lives. We are already seeing some of the problems caused by environmental changes. Floods are becoming common all over the world. Winters are colder and droughts harsher.

What is happening?

Global warming is a phenomenon that scientists are still trying to understand. The fact is that the earth surface and sea temperature is getting warmer. One of the causes of global warming is the excessive release of greenhouse gases into the atmosphere. These gases trap the heat from the sun just like the glass panel of a greenhouse.

Global warming and the greenhouse effect

There are many types of greenhouse gases. They include carbon dioxide, methane, ozone and nitrous oxide. Human activities that release greenhouse gases include burning of wood and fossil fuel (coal, oil and gas).

Name one cause of the global climate change:

What will you do for Gaia?

Name three things you can do to help fight climate
